

PLACING WEB PAGES ON GTMC.NET SERVER

The customer creates the web page. All pages must be in HTML format.

The customer should choose a login name, password and directory name (ex. Travel Concepts has the directory tc). This information will need to be added to the FTP Server.

Customer needs to get FTP software or download it from the Internet. For example, Windows 95 users can go to www.windows95.com, search for ftp and download freeware software from the site.

Connect to FTP

Host:	www.gtmc.net
User Name	customer's login name
Password:	customer's password

After the customer connects with their name and password their directory should automatically show up.

The files that are sitting on the customer's computer will show up on the Local side and the files in the customer's directory on the Server is the Host side. To transfer a file to the Server choose the file on the Local side that you want to transfer and click on the arrow pointing to the Host side. This will send the file into the directory on the Server.

Important: Please note that the home page needs to have the file name index.html.

The customer will have a URL address of <http://www.gtmc.net/subscribers/> "dir name"
(ex. <http://www.gtmc.net/subscribers/tc>)
